# SEARCH FOR INCOME

Fourth Quarter 2017

# YIELDS RISE AS TAX CUTS BECOME LAW

#### KFY TAKFAWAYS

The trend of yield curve flattening continued in the fourth quarter, as short-term yields rose considerably, with more muted moves in longer-term yields.

Several LPL Research managed MWP models focus on income generation, including Income Focused, Quad-Core: Income, and Franklin Templeton Income.

Recommendations for active and passive income suggestions are available from LPL Research's Recommended List, which includes mutual funds and exchange-traded products (ETP).\*

\*Many of the asset classes/sectors can be used individually or in a diversified portfolio, and several are currently employed in our model portfolios. Many of the asset classes/sectors are also higher risk and prone to weakness in the event of equity market declines.

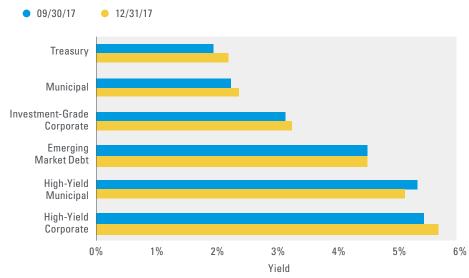

All return figures are as of December 31, 2017, unless otherwise stated.

Tax reform progress and ultimate passage during the fourth quarter dominated headlines, sending short-term yields much higher amid increasing expectations for future Federal Reserve (Fed) rate hikes. With longer-term Treasury yields more muted, the Treasury yield curve flattened again over the quarter, and made for a positive month for all major fixed income sectors [Figure 1].

Much like the first three quarters of the year, economically sensitive domestic sectors of the bond market were aided by investors' ongoing search for income in a low-yield, low-return environment and by steady economic data, which continued to push equity markets significantly higher.

Longer-dated fixed income generally outperformed their shorter-dated counterparts, as the rise in shorter-term Treasury yields outpaced that of longer-dated yields. More economically sensitive, lower-rated sectors tended to outperform higher-quality sectors.

#### **YIELDS INCREASED IN MOST SECTORS DURING Q4 2017**

Source: LPL Research, Bloomberg Barclays Index 12/31/17

All Bloomberg Barclays indexes mentioned herein are unmanaged and cannot be invested into directly. Past performance is no guarantee of future results.

The economic forecasts set forth in the publication may not develop as predicted.

The yields referenced in this publication are based on these indexes: Bloomberg Barclays U.S. Treasury Index, Bloomberg Barclays Municipal Bond Index, Bloomberg Barclays Capital U.S. Corporate Index, Bloomberg Barclays EM USD Aggregate, Bloomberg Barclays Capital High Yield Municipal Bond Index, Bloomberg Barclays U.S. Corporate High Yield

In general, we prefer to look domestically for income-generating investments given the more favorable economic environment in the United States, which may continue to support credit quality. Currently, our best ideas for potential income generation are:

- High-yield bonds (taxable and tax-free)
- Bank loans (floating-rate securities)
- Preferred stocks
- Investment-grade corporate bonds (intermediate and long-term)
- Emerging market debt (EMD)

LPL Research has several options available within the Model Wealth Portfolios platform, which combine multiple asset classes and sectors and provide exposure to several of these ideas. The primary goal of these portfolios is to seek excess total return; the secondary goal is to pursue higher overall yields than the LPL Research blended benchmarks.

### ASSET CLASS IDEAS

#### **High-Yield Bonds (Taxable and Tax-Free)**

Despite the overall rise in interest rates, high yield continued to move higher during the fourth quarter with a 0.5% total return. Tax cuts finally passing through Congress, ongoing equity market strength, improving default expectations, and the continuation of global investors' reach for yield drove high-yield strength during the quarter. The price of oil rose 16.9% during the fourth quarter,

adding a further tailwind to high yield. Default forecasts for high yield remain quite low for 2018, yet much of that optimism appears to be already priced in, leaving high yield slightly on the expensive side of our fair value estimate. Given the continuing strength of the asset class since mid-February 2016, the sector may have little room for error. Also, the significant richening in valuations during 2016 and 2017 means future returns could be driven more by yield rather than continued price appreciation from spread tightening, which may be harder to come by.

Despite being a tailwind in the fourth quarter, the price of oil remains a key driver of the high-yield market, and future weakness below certain key levels may translate to pullbacks within high yield. Equity market drawdowns or volatility may also translate to headwinds.

Based on the Bloomberg Barclays High Yield Index, the average yield of the high-yield bond market rose to end 2017 at 5.7%, up from 5.5% to end the third quarter, but still well below the 20-year average of 9.1% [Figure 2].

The average yield advantage of high-yield bonds to Treasuries fell to 3.4% as of December 31, 2017, down from 3.5% at the end of the third quarter [Figure 3].\* This yield advantage has continued to decrease in early 2018 to 3.1% as of January 29, 2018. This is the lowest level since mid-2007.

As the wave of defaults in the energy, metals, and mining sectors has largely subsided, defaults overall remain limited. High-yield bond valuations are pricing in a decrease in defaults over the

Bonds are subject to market and interest rate risk if sold prior to maturity. Bond values will decline as interest rates rise and are subject to availability and change in price.

High-yield/junk bonds are not investment-grade securities, involve substantial risks, and generally should be part of the diversified portfolio of sophisticated investors.

There is no guarantee that a diversified portfolio will enhance overall returns or outperform a nondiversified portfolio. Diversification does not ensure against market risk.

An investment in an exchange traded product (ETP), structured as a mutual fund or unit investment trust, involves the risk of losing money and should be considered as part of an overall program, not a complete investment program. An investment in ETPs involves additional risks such as not diversified, price volatility, competitive industry pressure, international political and economic developments, possible trading halts, and index tracking errors.

An increase in interest rates may cause the price of bonds and bond mutual funds to decline.

<sup>\*</sup>Yield advantage is the additional yield for high-yield bonds relative to comparable maturity Treasuries.

# 2 AVERAGE YIELD OF HIGH-YIELD BONDS ROSE OVER Q4 2017 BUT REMAINS LOW RELATIVE TO HISTORY

Bloomberg Barclays High Yield Bond Index Average Yield
 20-Year Average

Source: LPL Research, Barclays, Bloomberg 12/31/17

The Bloomberg Barclays High Yield Bond Index is an unmanaged index and cannot be invested into directly. Past performance is no quarantee of future results.

coming year [Figure 4]. According to Moody's, the global high-yield default rate rose slightly to 2.9% over the fourth quarter, up from 2.8% to end the third quarter. Though there was an increase, defaults remain very low on a historical basis.

For diversification purposes, we recommend suitable investors use a mutual fund or exchange-traded product (ETP) for exposure to this asset class.

#### **Municipal High-Yield Bonds**

Investors, regardless of tax bracket, may wish to consider municipal (tax-free) high-yield bonds. According to the Bloomberg Barclays High-Yield Municipal Index, the average yield of tax-free, high-yield bonds is 5.1% (as of December 31, 2017), which is lower than that of the taxable high-yield market. This translates to a taxable equivalent yield of 8.5% (assuming a 39.6% tax rate), which is compelling. Because of the diversity of the municipal high-yield market, many securities may not yield this much.

# SPREADS ON HIGH-YIELD BONDS DECREASED FOR THE EIGHTH CONSECUTIVE QUARTER

Bloomberg Barclays High Yield Bond Spread to Treasuries
 20-Year Average

Source: LPL Research, Barclays, Moody's 12/31/17

High-yield spread is the yield differential between the average yield of high-yield bonds and the average yield of comparable maturity Treasury bonds.

# 4 AVERAGE YIELD ADVANTAGE OF HIGH-YIELD BONDS DECREASED FURTHER AS DEFAULTS HELD AT LOW LEVELS

Source: LPL Research, Federal Reserve, Moody's 12/31/17

The average yield advantage of BBB-rated municipal bonds to AAA-rated, a proxy for the spread on municipal high-yield bonds, ended the fourth quarter at 1.1%, below the level it ended the third quarter. The average yield spread remains below the five-year average and is heavily influenced by volatile Puerto Rican issues. The situation in Puerto Rico worsened due to devastating hurricanes last year, but spillover to other segments of the market has been very limited. The greater yield is not without risks. Municipal high-yield bonds have longer maturities; therefore, they tend to be more interest rate sensitive than their taxable counterparts—a risk worth noting given the gradual increase in interest rates we expect in 2018. Interest rate sensitivity was one of the primary drivers of high-yield municipal bond weakness in 2013 and late 2016, but it was a strong positive driver in 2014 and the first half of 2017.

Credit quality trends, like those of the taxable market, are largely supportive of the sector in our view. According to the Municipal Securities Rulemaking Board and Municipal Market Advisors data, the number of defaulted municipal issuers in 2017 was significantly lower than that of 2014–16, all three of which were very low default years. In fact, it was the lowest number of municipal defaults since the data became available in 2009. The dollar amount of defaults in 2017 was higher than recent years, due to more (and larger) Puerto Rico issuers defaulting than last year. In general, municipal defaults remain isolated and have been concentrated in more speculative sectors like Puerto Rico.

Please be aware that the vast majority of tax-free, high-yield funds generate income that is subject to alternative minimum tax (AMT). We recommend that suitable investors use a fund to gain exposure. Please contact the fund or ETP companies directly to obtain a copy of the prospectus for the percentage of income subject to AMT.

# Floating-Rate Bank Loans: More Conservative Approach to High Yield

Companies rated below investment grade issue loans (debt) via banks for their short-term funding needs (hence the name "bank loans"). Most bank loans are senior secured debt, as the companies generally pledge specific tangible assets for the loan, ranking them above traditional bonds and equities in a corporation's capital structure. This means that they are paid before unsecured bonds in the event of a default, and recovery rates are historically higher than unsecured bonds.

These securities typically pay a higher yield than short-term securities, generally 1.0-4.0% above Libor (the London Interbank Offered Rate), and seek to provide protection against rising interest rates by adjusting interest payments at regular intervals to reflect changes in a short-term rate (usually three-month Libor). Unlike traditional fixed-rate bonds (where rising interest rates hurt their prices), when rates rise, bank loans pay a higher rate and therefore their prices do not necessarily fall. Conversely, bank loans generally do not benefit from rising bond prices when interest rates fall. With an above-average yield, bank loans are an income alternative that may help balance the increased interest rate sensitivity of high-quality, income-oriented bond asset classes.

Municipal bonds are subject to availability, price, and to market and interest rate risk if sold prior to maturity. Bond values will decline as interest rate rise. Interest income may be subject to the alternative minimum tax. Federally tax-free but other state and local taxes may apply.

Please note while many municipal bonds may remain suitable investments, when longer-term interest rates increase, some municipalities may be forced to roll over retiring debt at higher rates, which could lead to financial distress in municipalities.

If long-term rates rise, selling pressure may subject funds and ETPs to greater volatility and unanticipated losses.

Floating-rate bank loans are loans issued by below investment-grade companies for short-term funding purposes with higher yield than short-term debt and involve interest rate risk, credit and default risk, market and liquidity risk.

The yield of three-month Libor rose from 1.33% at the end of the third quarter to 1.69% at the end of 2017. The sharp rise was driven by rising short-term rates broadly, as Fed rate hike expectations marched significantly higher. The majority of the bank loan market has a 1% Libor floor. With Libor above that level as of April 2017, the rates on some bank loans have begun to float, increasing bank loans' attractiveness, especially if Libor is further supported by additional Fed rate hikes. However, the bank loan market is a par market and many issues may be called at par at any time. With the majority of issues in the market already trading above par, call risk may become more pronounced as short-term rates move higher.

Although high yield has historically yielded more than bank loans, bank loans have yielded more than high yield since December 2016. That yield disparity fell slightly during the fourth quarter, with bank loans ending the quarter yielding 0.6% more than high-yield bonds, down slightly from 0.7% to end the third quarter [Figure 5]. Bank loans have historically exhibited less volatility than high-yield bonds (though still more than investment-grade issues), and therefore, may be a better option for more conservative investors. Like high-yield bonds, credit-quality metrics for bank loans are stable. Default rates are lower and recovery rates are historically better compared with high-yield bonds, but credit risk remains.

#### Preferred Stocks: Potentially Attractive Yields

Preferred stocks are fixed income securities that income-seeking investors may want to consider. The financial sector, which comprises roughly 80% of all preferred issuers, has benefited from stable-to-improving bank credit-quality metrics. The Trump administration has indicated that it may lean toward financial industry deregulation, which could create growth opportunities.

We still believe that the sector can be used as a potential income generator in today's fixed income environment, but caution is warranted. Average yields were unchanged over the fourth quarter of 2017, remaining at the 4.6% yield level seen at the end of the third quarter. The varied nature of the preferred market means that the yield advantage to comparable Treasuries may vary depending on the specific investment product.

Given the favorable economic backdrop and improved credit quality of financials, we believe that the sector can be used as an income option.

Since preferred stocks have extremely long 30-to 50-year maturities, they possess interest rate sensitivity. The sector exhibited resiliency during bouts of rising interest rates over the past three years, but price weakness in early 2018 serves as a reminder to investors that sharp increases in rates can weigh on returns. That same rate sensitivity was a strong positive driver in the first quarter of 2017. The yield advantage to Treasuries will help offset higher interest rate risk as does the probability of early redemptions, but investors need to be aware of this risk.

# Investment-Grade Corporate Bonds: Historically Stable in Slow-Growth Environments

Investment-grade corporate bond yields remain low historically, but the asset class continues to be an income-producing option for suitable investors seeking higher-quality bonds [Figure 6]. As of December 31, 2017, the average yield of investment-grade corporate bonds was 3.3%, slightly higher than the yield at the end of the third quarter.

For some investors, such yield levels may not be exciting, but yields vary depending on the specific investment used. We believe that investment-grade corporate bonds can still be used as an income-producing option in fixed income markets, considering historically low Treasury and mortgage-backed securities yields.

Par value is the nominal value of a bond, share of stock, or a coupon as indicated in writing on the document specified by charter.

Preferred stock investing involves risk, which may include loss of principal.

# BANK LOANS' YIELD ADVANTAGE TO HIGH YIELD FELL SLIGHTLY, BUT REMAINS HIGH HISTORICALLY

Yield Advantage of Bank Loans to High-Yield Bonds

Source: LPL Research, Barclays, Bloomberg 12/31/17

# AVERAGE CORPORATE BOND YIELD MOVED SLIGHTLY HIGHER DURING Q4 2017

Bloomberg Barclays Corporate Bond Index Yield

#### 8 EMD YIELD SPREADS DECLINED FURTHER IN Q4 2017

Average EMD Yield Spread to Comparable Maturity Treasuries
 10-Year Average

Source: LPL Research, Bloomberg 12/31/17

The Bloomberg Barclays EM USD Index is an unmanaged index, which cannot be invested into directly. Past performance is no guarantee of future results.

At the end of 2017, the average investment-grade corporate bond yield spread to Treasuries was 0.9%, below the 20-year average of 1.5%, and below the 1.0% level at the end of the third quarter [Figure 7]. That spread has continued to decrease to below 0.9% as of January 29, 2018.

The ability of corporations to repay debt obligations in a timely manner (credit quality) has plateaued but remains strong. Nonfinancial debt-to-earnings ratios are increasing, though still at manageable levels. Corporate credit-quality metrics may support stable yield spreads.

# **Emerging Market Debt: May Benefit** from Emerging Market Growth

Concerns about potential protectionist trade policies remain moving into 2018, but the asset class continued to perform well to close out 2017. Like high yield, EMD was boosted by a rise in the price of oil, which has been an important driver in recent years.

Over the fourth quarter of 2017, the average yield advantage of EMD above comparable Treasuries fell to 2.3% as of December 31, 2017, below the 2.5% level at the end of the third quarter [Figure 8].

A 4.0% yield spread has represented good value over the last five years, as yield spreads have rarely stayed above that level. The average EMD yield of 4.5%, though below its 5-year average of 5.0%, stands out in a low-yield world. The challenging environment for bonds overall (rising interest rates), commodity-related weakness, or the removal of central bank accommodation may provide headwinds. The sector may also remain vulnerable to protectionist trade policies coming to fruition.

We still expect most emerging market countries to exhibit higher growth rates than their developed country counterparts, which may help support credit quality over a longer horizon. Additionally, an average yield spread of 2.3% (as of December 31, 2017) may provide a buffer to potential risks. Local currency EMD, however, may be more volatile than dollar-denominated EMD, as has historically been the case, due to currency volatility. We believe that EMD can still be used for suitable income-seeking and total return-oriented investors.

Corporate bonds are considered higher risk than government bonds but normally offer a higher yield and are subject to market, interest rate, and credit risk, as well as additional risks based on the quality of issuer coupon rate, price, yield, maturity, and redemption features.

Please note regardless of credit quality, longer-duration fixed income corporate bonds could potentially suffer market losses associated with a rapid, uncontrolled increase in interest rates.

Government bonds and Treasury bills are guaranteed by the U.S. government as to the timely payment of principal and interest and, if held to maturity, offer a fixed rate of return and fixed principal value. However, the value of a fund shares is not guaranteed and will fluctuate.

The risks associated with investment-grade corporate bonds are considered significantly higher than those associated with first-class government bonds. The difference between rates for first-class government bonds and investment-grade bonds is called investment-grade spread. The range of this spread is an indicator of the market's belief in the stability of the economy.

Investing in foreign and emerging market debt securities involves special additional risks. These risks include, but are not limited to, currency risk, geopolitical and regulatory risk, and risk associated with varying settlement standards.

Significant upward pressure on domestic interest rates and a corresponding widening of credit spread could negatively impact the market price of emerging market debt.

# MODEL IMPLEMENTATION

#### Suggested LPL Research Model Wealth Portfolios (MWP)

- MWP Income Focused Seeks excess return and, secondarily, seeks to generate higher overall yields than our blended benchmarks.
- MWP Quad-Core: Income Seeks to generate yield while limiting interest rate sensitivity.
- Franklin Templeton Income Seeks to maximize current income by emphasizing areas of the market that have historically generated above-average yields.

MWP model performance section: pages 08-12.

Performance data quoted represent past performance. Past performance does not guarantee future results. The models' investment return and principal value will fluctuate. Upon redemption, shares may be worth more or less than their original cost. The models' performance may be lower or higher than the performance data quoted. Your results may vary. To obtain current month-end performance information, please contact your advisor.

The volatility of the index is materially different from the model portfolio.

The gross-of-fees performance quoted reflects the reinvestment of dividends and capital gains but does not reflect the maximum account fee of 2.50% (for the 2016 period performance reflects a maximum fee of 2.58% for select portfolios). Such a fee, if taken into consideration, will reduce the performance quoted above.

Please refer to pages 17 – 18 for index descriptions and investment objectives.

The Diversified Benchmarks are a tool to assist in capturing and explaining client portfolio performance. They represent a more encompassing asset class mix than the IO benchmarks. By incorporating additional asset classes in the benchmarks, the diversified benchmarks are more aligned with clients' typical investment portfolios.

Model Wealth Portfolios (MWP) are centrally managed fee-based portfolios constructed by LPL Financial Research. Investment choices include mutual funds and exchange-traded products (ETPs). The portfolios benefit from ongoing monitoring, rebalancing, and tax management services implemented by the LPL Financial Overlay Portfolio Management Group.

### **ACTIVE & PASSIVE INCOME IMPLEMENTATION**

#### Mutual Fund and ETP Income-Producing Ideas

- The following list comprises our suggestions for mutual funds and ETPs that provide exposure to the income-producing sectors we have outlined in this report.
- Our Analyst Top Pick (ATP), the fund with LPL Research's highest confidence of long-term outperformance vs. its benchmark, is listed first. The remaining funds and ETPs are listed alphabetically by ticker.

Income-producing ideas section: pages 13-16.

The performance data quoted represent past performance. Past performance is not an indicator of future results. Investment return and principal value will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. Current performance may be lower or higher than the performance information quoted. To obtain current monthend performance information, please refer to the manager's website.

The performance data quoted reflect the reinvestment of dividends and capital gains, is net of expenses and does not reflect the maximum account fee of 2.50% (for the 2016 period performance reflects a maximum fee of 2.58% for select portfolios). Such fee, if taken into consideration, will reduce the performance quoted above. The volatility of the benchmark used to compare performance is materially different from that of the portfolio.

30-day SEC yield: The fund's 30-day yield is based on yield to maturity of a fund's investments over a 30-day period and not on the dividends paid by the fund, which may differ.

Gross expense ratio (Gross Exp Ratio): The gross expense ratio is the fund's total annual operating expense ratio. It is gross of any fee waivers or expense reimbursements.

ETP shares are bought and sold at market price (closing price) not net asset value (NAV) and are not individually redeemed from the Fund. Market price returns are based on the midpoint of the bid/ask spread at 4:00 pm Eastern Time (when NAV is normally determined), and do not represent the return you would receive if you traded at other times.

Exchange-traded products (ETPs) are defined as exchange-traded funds (ETFs), exchange-traded notes (ETNs), and closed-end funds (CEFs).

Market Return Annualized (Mkt Ret Annlzd) 1, 5, and 10 year: An annualized total return is the geometric average amount of money earned by an investment each year over a given time period. It is calculated as a geometric average to show what an investor would earn over a period of time if the annual return was compounded.

#### IMPORTANT DISCLOSURES

The MWP portfolios are exposed to mutual funds and ETPs.

The opinions voiced in this material are for general information only and are not intended to provide specific advice or recommendations for any individual security. To determine which investment(s) may be appropriate for you, consult your financial advisor prior to investing.

Investors should consider the investment objectives, risks, charges, and expenses of the investment company carefully before investing. The prospectus, and if available, the summary prospectus, contains this and other information about the investment company. You can obtain a prospectus from your financial representative. Read carefully before investing.

Investing in mutual funds, or exchange-traded funds (ETF) involve risk, including possible loss of principal. Investments in specialized industry sectors have additional risks, which are outlines in the prospectus.

There is no assurance that the techniques and strategies discussed are suitable for all investors or will yield positive outcomes. The purchase of certain securities may be required to affect some of the strategies.

This information is not intended to be a substitute for specific individualized tax, legal or investment planning advice. We suggest that you discuss your specific tax issues with a qualified tax advisor.

All information is believed to be from reliable sources; however, LPL Financial makes no representation as to its completeness or accuracy.

#### **DEFINITIONS**

Credit quality is one of the principal criteria for judging the investment quality of a bond. As the term implies, credit quality informs investors of a bond or bond portfolio's credit worthiness, or risk of default. Different agencies employ different rating scales for credit quality. Standard & Poor's (S&P) and Fitch both use scales from AAA (highest) through AA, A, BBB, BB, B, CCC, CC, C to D (lowest). Moody's uses a scale from Aaa (highest) through Aa, A, Baa, Ba, B, Caa, Ca to C (lowest). An independent, unaffiliated research company that rates fixed income securities. Moody's assigns ratings on the basis of risk and the borrower's ability to make interest payments.

Default rate is the rate in which debt-holders default on the amount of money that they owe. It is often used by credit card companies when setting interest rates, but also refers to the rate at which corporations default on their loans. Default rates tend to rise during economic downturns, since investors and businesses see a decline in income and sales while still required to pay off the same amount of debt.

London interbank offered rate (Libor): An interest rate at which banks can borrow funds, in marketable size, from other banks in the London interbank market. The Libor is fixed on a daily basis by the British Bankers' Association. The Libor is derived from a filtered average of the world's most creditworthy banks' interbank deposit rates for larger loans with maturities between overnight and one full year.

Moody's is an independent, unaffiliated research company that rates fixed income securities. Moody's assigns ratings on the basis of risk and the borrower's ability to make interest payments.

Municipal Market Advisors is an independent strategy, research and advisory firm.

Spread is the difference between the bid and the ask price of a security or asset.

Yield curve is a line that plots the interest rates, at a set point in time, of bonds having equal credit quality, but differing maturity dates. The most frequently reported yield curve compares the 3-month, 2-year, 5-year, and 30-year U.S. Treasury debt. This yield curve is used as a benchmark for other debt in the market, such as mortgage rates or bank lending rates. The curve is also used to predict changes in economic output and growth.

Call risk is the risk that a callable bond will be repaid early and that the money earned may not be able to be reinvested in a security with a comparable return.

#### INDEX DESCRIPTIONS

Bloomberg Barclays Corporate Bond Index is an unmanaged index of investment grade rated bonds issued by corporations and quasi-government agencies. Corporate bonds issued by foreign entities but denominated in U.S. dollars are also included in the index.

The Bloomberg Barclays Emerging Markets USD Aggregate Index is a flagship hard currency Emerging Markets debt benchmark that includes fixed and floating-rate US dollar-denominated debt issued from sovereign, quasi-sovereign, and corporate EM issuers. Country eligibility and classification as Emerging Markets is rules-based and reviewed annually using World Bank income group and International Monetary Fund (IMF) country classifications. This index was previously called Barclays US EM Index, and history is available back to 1993.

Bloomberg Barclays High Yield Bond Index is an unmanaged index of corporate bonds rated below investment grade by Moody's, S&P or Fitch Investor Service. The index also includes bonds not rated by the ratings agencies.

Bloomberg Barclays U.S. Aggregate Bond Index is comprised of the Barclays Government/Corporate Bond Index, Mortgage-Backed Securities Index, and Asset-Backed Securities Index, including securities that are of investment grade quality or better, have at least one year to maturity, and have an outstanding par value of at least \$100 million.

The Bloomberg Barclays U.S. Corporate High-Yield Index measures the market of USD-denominated, noninvestment-grade, fixed-rate, taxable corporate bonds. Securities are classified as high yield if the middle rating of Moody's, Fitch, and S&P is Ba1/BB+/BB+ or below, excluding emerging markets debt.

The Bloomberg Barclays U.S. High Yield Municipal Bond Index is an unmanaged index made up of bonds that are noninvestment grade, unrated, or rated below Ba1 by Moody's Investors Service with a remaining maturity of at least one year.

The Bloomberg Barclays U.S. Municipal Index covers the USD-denominated, long-term, tax-exempt bond market. The index has four main sectors: state and local general obligation bonds, revenue bonds, insured bonds, and prerefunded bonds.

The Bloomberg Barclays U.S. Treasury Index is an unmanaged index of public debt obligations of the U.S. Treasury with a remaining maturity of one year or more. The index does not include T-bills (due to the maturity constraint), zero coupon bonds (Strips), or Treasury Inflation-Protected Securities (TIPS).

Bloomberg Barclays U.S. Government/Credit 1-3Y Index measures the performance of U.S. dollar-denominated U.S. Treasury bonds, government related bonds, and investment-grade U.S. corporate bonds that have a remaining maturity of greater than or equal to one year and less than three years.

Bloomberg Barclays U.S. Long Government/Credit Index is composed of all bonds that are of investment grade with at least ten years until maturity.

Bank of America Merril Lynch Preferred Stock Hybrid Index measures the performance of preferred stock securities.

Citigroup 3-Month T-Bill Index represents monthly return equivalents of yield averages of the last 3-month Treasury bill issues.

The JPMorgan Emerging Markets Bond Index Global ("EMBI Global") tracks total returns for traded external debt instruments in the emerging markets, and is an expanded version of the JPMorgan EMBI+. As with the EMBI+, the EMBI Global includes U.S. dollar-denominated Brady bonds, loans, and Eurobonds with an outstanding face value of at least \$500 million. It covers more of the eligible instruments than the EMBI+ by relaxing somewhat the strict EMBI+ limits on secondary market trading liquidity.

The MSCI EAFE Index is recognized as the pre-eminent benchmark in the United States to measure international equity performance. It comprises the MSCI country indices that represent developed markets outside of North America: Europe, Australasia, and the Far East.

The MSCI Emerging Markets Index captures large and mid-cap representation across 23 emerging markets (EM) countries. With 822 constituents, the index covers approximately 85% of the free float-adjusted market capitalization in each country.

The Russell 2000 Index measures the performance of the small cap segment of the U.S. equity universe. The Russell 2000 Index is a subset of the Russell 3000 Index representing approximately 10% of the total market capitalization of that index.

The Russell 3000 Index measures the performance of the largest 3,000 U.S. companies representing approximately 98% of the investable U.S. equity market.

The S&P 500 Index is a capitalization-weighted index of 500 stocks designed to measure performance of the broad domestic economy through changes in the aggregate market value of 500 stocks representing all major industries.

The S&P/LSTA U.S. Leveraged Loan 100 Index is designed to reflect the largest facilities in the leveraged loan market. It mirrors the market-weighted performance of the largest institutional leveraged loans based upon market weightings, spreads, and interest payments. The index consists of 100 loan facilities drawn from a larger benchmark, the S&P/LSTA (Loan Syndications and Trading Association), Leveraged Loan Index (LLI).

#### INVESTMENT OBJECTIVES

Aggressive Growth will essentially be fully invested in equity assets at all times (with the exception of a 5% cash position). Investors in this portfolio should have a long time horizon of 10 years or more, an understanding of the volatile history of equity investments, and a propensity to add money to the account on a systematic basis. This portfolio is very aggressive by nature and should not be considered by anyone unwilling to take on significant risk.

Growth will be targeted to an allocation of 80% in equity assets and 20% in fixed income assets (including a 5% cash position). Investors in this portfolio should have a long time horizon, an understanding of the volatile history of equity investments, and a propensity to add money to the account on a systematic basis. This portfolio is aggressive by nature and should not be considered by anyone unwilling to take on significant risk.

Growth with Income Investors in this portfolio should have a long time horizon, and an understanding of the volatile history of equity investments. The primary investment objective of this portfolio is growth of principal. Fixed income assets are included to generate income and reduce overall volatility.

Income with Moderate Growth will be targeted to a normal allocation of 40% in equity assets and 60% in fixed income assets (including a 7% cash position). Investors in this portfolio should have a time horizon of more than five years, and be comfortable with the volatile history of equity investments. The primary investment objective of this portfolio is income, with growth of principal an important consideration. Fixed income assets form the core of the portfolio, generating income and lowering the portfolio's overall volatility. Equity assets provide the opportunity for long-term growth of principal.

Income with Capital Preservation will be targeted to a normal allocation of 21% in equity assets and 79% in fixed income assets (including a 10% cash position). Investors in this portfolio should have a time horizon of more than five years, and be comfortable with the volatility that will occur within the modest equity portion of their investment portfolio. The primary investment objective of this portfolio is income, with growth of principal as a secondary concern. Fixed income assets form the core of the portfolio, generating a steady income stream. A small investment in equity assets provides the opportunity for modest long-term growth of principal.
